Georeferencing a Shapefile in QGIS

Objective: To georeference a shapefile using QGIS and align it accurately with a reference map.

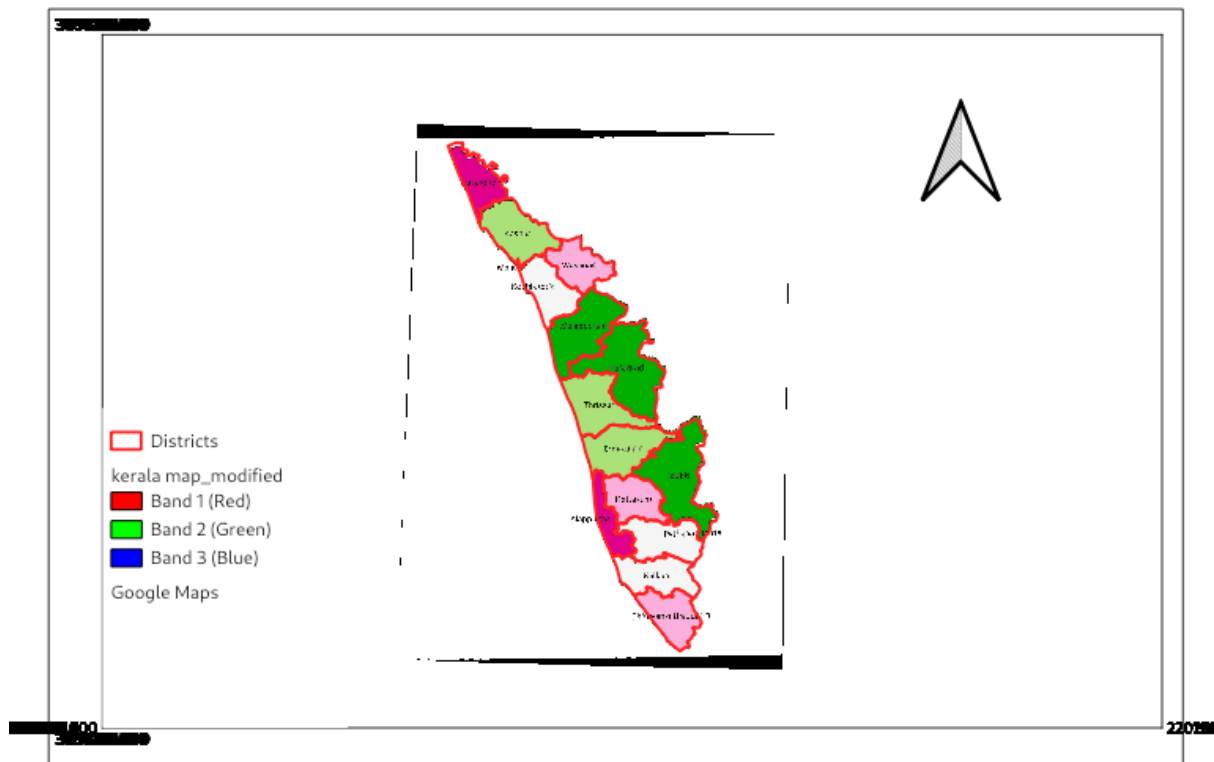

Software Required: QGIS

Procedure:

1. Open the shapefile in QGIS.
2. Go to Layer → Georeferencer → Open Raster, and select the reference map (e.g., Kerala map).
3. Add Ground Control Points (GCPs) by locating known points on the reference map.
4. For each GCP, click the corresponding point on the shapefile.
5. Repeat for multiple points to improve accuracy.
6. Start the georeferencing process.
7. After georeferencing, go to Layer Properties and set transparency if needed.

Results:

Image 1

Conclusions: The shapefile was successfully georeferenced, enabling accurate overlay with other spatial data in QGIS.
