BATCH: CE01

Exercise No: 6

Date: 26/09/2025

Creating a Campus Map using Google Earth and QGIS

Objective: To generate a campus map by marking physical features such as trees, roads, buildings, and grounds using Google Earth, and to prepare a professional map layout in QGIS with essential cartographic elements.

Software Required:

- Google Earth
- QGIS

Procedure:

1. Open Google Earth and navigate to the campus location.
2. Mark features such as trees and roads using placemarks and line tools.
3. Draw polygons to represent buildings and grounds.
4. Export the created features as a KML file.
5. Import the KML file into QGIS for further processing.
6. Add shapefiles through Layer → Add Layer → Add Vector Layer → Browse file → OK.
7. Create a Print Layout: Project → New Print Layout → Assign name → OK.
8. Insert a rectangular frame using Add Item → Add Shape → Rectangle.
9. Add the imported map: Add Item → Add Map → Drag to rectangle.
10. Insert a legend: Add Item → Add Legend → Click and edit properties (font, name).
11. Add a scale bar: Add Item → Add Scale Bar → Place on map.
12. Insert a north arrow: Add Item → Add North Arrow → Place appropriately.
13. Export the final map as an image: Layout → Export as Image → Set location and resolution → OK.

Results: A campus map was successfully created, showing the designated features (trees, roads, buildings, grounds) with all essential map elements including legend, scale bar, and north arrow.

Image 1

Conclusions: The exercise demonstrated how Google Earth can be used to digitize real-world features and how QGIS can be applied to create professional map layouts. The integration of these tools makes spatial data visualization and map creation more efficient and accurate.
